Manitoba Chimney-side Monitoring Protocol for COVID-19
Each Wednesday from May 26-June 24th 2020

Early spring monitoring tracks the arrival and dispersal of migrating Chimney Swifts (CHSW), records peak counts, and provides the basis for subsequent trend analysis. The Manitoba Chimney Swift Initiative (MCSI) coordinates Manitoba volunteers for our provincial MCSI Roost and Nest Site Monitoring Program.

The MCSI-collected data are shared with biologists at the Canadian Wildlife Service, Quebec Region, who collate and analyse the national results.

WHEN DO WE MONITOR?

In 2020 we are monitoring every Wednesday evening from May 26 – June 24, 2020. In case of poor weather, the rain day will be the Thursday of each week.

USE THE “MCSI CHIMNEY-SIDE MONITORING REPORT 2020” datasheet for all observations made in Manitoba during 2020 (details follow).

For ALL nights: watch the chimneys for 1 hour prior to sunset through to ½ hour after sunset; record the time of every entry or exit event; and note the number of swifts seen during the entry or exit events.

The extended viewing time before sunset informs us how temperature/weather conditions influences the time of roosting. Also, we like to designate active chimneys as roost or nest sites. We distinguish between roost and nest sites on the basis of Chimney Swift behaviour.

Roost sites are occupied by Chimney Swifts resting for the night. Typically, only entries occur during the roosting hour = ½ hour before to ½ hour after sunset; the period of first morning departures is ½ hour before to ½ hour after sunrise.

Nest sites are used during the daytime (times outside of the roosting hour and the period of first morning departures). Activity patterns vary with different stages of nesting e.g., daytime entries and exits in early June indicate nest building is underway.
GENERAL INSTRUCTIONS:

First and foremost, please follow our ABCD’s of Chimney Swift monitoring during COVID-19:

Abide by current Covid-19 Public Health directives.

Be aware of how your presence may impact other people. Do your best to stay off sidewalks to allow for physical distancing and respect the privacy of residents who may be isolating.

Choose the best monitoring approach to engage Chimney Swifts in 2020. Keep your personal safety, and the safety of those around you, at the forefront.

Drive with due diligence. Travel prudently and try to stay in your neighbourhood, if possible.

Arrival time: Arrive at your site and be ready to start observations at the appropriate time. Since the counts will be conducted on identical dates for all sites in Canada, it is recommended that you conduct the count even if there is light drizzle or light intermittent rain. However, do not monitor roost sites when electrical storms are in progress. Safety comes first.

Filming swifts entering the site: When the number of swifts at a roost is high e.g., ~ 100 individuals, it may be very useful to film the birds entering the chimney with a video camera. Then it is possible to count the swifts by watching the film sequence in slow motion. Total roosting Chimney Swifts = total entries minus total exits, adjusted for the sequence of the events (see details below).

COMPLETING THE MCSI MONITORING REPORT 2019 DATASHEET:

Use the MCSI Chimney-side Monitoring Report 2020 datasheet for monitoring sessions in Manitoba. The datasheet is posted as a WORD and PDF document (in the Resources and Links section of the MCSI website)

DATE
Write down the date on which your monitoring session takes place.
**LOCATION**
If you know the address of your site, write it down. If this is unknown, please write down the approximate location of the site. For example, I watched “the building on the west side of Banning St., north of Portage Ave behind Shoppers Drug Mart”.

**MCSI SITE NO.**
Each site is identified with an individual number. The coordinator will give you the site number for each chimney assigned to you. Our database is posted at: https://www.mbchimneyswift.com/Documents/2014_18_database.pdf.

**TIME OF OBSERVATION = Start/End Times**
Write down the start time and end time of your observations.

**DURATION OF OBSERVATION**
Write down the total length of time (minutes) which you observed the site for.

**DAYTIME OR ROOSTING HOUR**
Circle the applicable choice(s). Daytime observations take place any time beyond ½ hour after sunrise until ½ hour before sunset. Roosting hour observations take place from ½ hour before sunset until ½ hour after sunset (the swifts leave the roost within ½ hour of sunrise the next morning).

**SUNSET TIME**
Write down the sunset time for the day of observation. Sunset (and sunrise) times can be found online at http://www.theweathernetwork.com/ or the bottom of Environment Canada forecast pages http://weather.gc.ca/forecast/canada/index_e.html?id=MB, and on the weather page of newspapers.

**START TEMP.**
Indicate the temperature at the beginning of the observation period. You can find this information online at http://www.theweathernetwork.com/, http://weather.gc.ca/forecast/canada/index_e.html?id=MB, or use your vehicle’s temperature gauge. Temperature is one of the most important factors influencing Chimney Swift activity. Flying insects are not abundant in the air at temperatures less than 13° C which makes feeding difficult for the swifts. We need to learn more about temperature related Chimney Swift activity, so please try your best to fill this information in as accurately as possible on the datasheet.

**Name of Observer(s)**
Write down the names of all observers present.
Contact Information
Write down the email address or phone number of one of the observers present.

TIME – ENTRY (↓) OR EXIT (↑) – NO. OF CHSW
TIME
Write down the time when a Chimney Swift(s) enters or exits the chimney (e.g., 8:45), one time per entry or exit event.

ENTRY OR EXIT
If you observe a swift(s) entering the chimney, mark an arrow pointing down (↓). If you see a swift(s) exiting the chimney, mark an arrow pointing up (↑).

NO. OF CHSW
Record the total number of Chimney Swifts which you saw during the entry or exit event.

COMMENTS
If you observe anything that you feel is worth noting while monitoring your site, please enter this in the comments section. Even if you do not observe swifts entering your site, you may notice something that could potentially influence their presence or absence. For example, a rock dove (pigeon) walking on a chimney rim may discourage a Chimney Swift entry at the time of your observation.

TOTAL ENTRIES
Count the total number of Chimney Swifts entering into the site.

TOTAL EXITS
Count the total number of Chimney Swifts exiting from the site.

MAX. IN CHIMNEY
The maximum number of Chimney Swifts in the site is determined by the total entries and total exits, adjusted for the sequence of events. Consider two different sequences which both involve 5 entries and 2 exits. For sequence A, which starts with 1 exit followed by 4 entries, 1 exit, and 1 entry, the maximum in the chimney = 4. For sequence B, which starts with 2 entries followed by 2 exits, 1 entry, and 2 entries, the maximum in the chimney = 3. No worries - we can calculate this value for you as long as you provide all the details of “TIME – ENTRY (↓) OR EXIT (↑) – NO. OF CHSW".
MAX. SEEN IN THE AIR
If other swifts are flying near the chimney, and you have an extra set of “eyes” helping, do your best to count the swifts and write down the number. This provides an estimate of how many Chimney Swifts are in the area compared to how many are using your site. It is very important to keep monitoring the chimney rim as the first priority.

Wind (Beaufort Scale; provided on datasheet)
Use the Beaufort Scale to estimate wind speed at the beginning of your observations.

Cloud Cover
Look up at the sky and estimate the percentage covered by clouds. Use the cloud cover scale at the bottom of the datasheet to indicate the range your estimate falls within.

Precipitation
Indicate the conditions at the start of your monitoring session: None, Occasional, Light Rain, Heavy Rain, Thundershower, or Other (specify).

Make a note if weather conditions change appreciably during your monitoring session.

SUBMITTING YOUR MONITORING REPORTS:

We request that participants send their data to the MCSI Monitoring Coordinator in a timely fashion so that updates can be sent out to all participants.

Datasheets may be filled out electronically and emailed to: mbchimneyswift@gmail.com OR they may be filled out manually and mailed to: Amanda Shave, MCSI Coordinator, Nature Manitoba, 401 - 63 Albert Street, Winnipeg, MB R3B 1G4.

If you wish to submit photographs of the site(s) monitored, please specify the name of the photographer, the date the photograph was taken, and the name and address of the site that was photographed.

The MCSI website can be found at: http://www.mbchimneyswift.com

Questions? Don’t hesitate to contact us. You can reach us at: mbchimneyswift@gmail.com for general inquiries and monitoring information; mcsi.outreach@gmail.com for habitat stewardship and outreach information.
MCSI is always interested in receiving reports of new Chimney Swift sites and opportunistic observations. Tell us about any Chimney Swifts you see in 2020.

As our project is built upon the foundation of volunteers, the MCSI Steering Committee thanks you for your generous contribution of time and support!
